SLURRY SAMPLERS TYPE 'D'

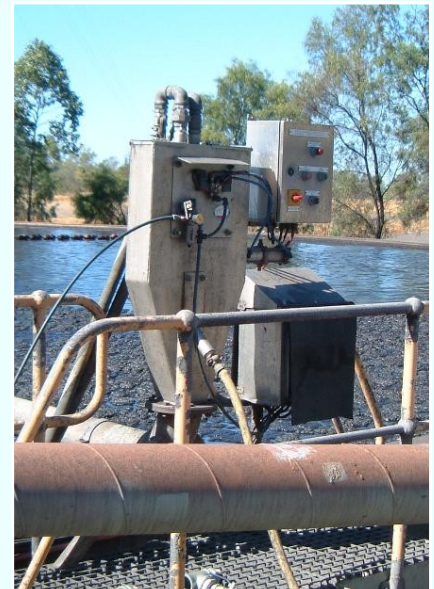

Quality Handling Systems manufactures a range of Slurry Samplers for various applications. The Type 'D' Slurry Sampler is a simple and robust pneumatic drive sample splitter suitable for most liquid and slurry applications.

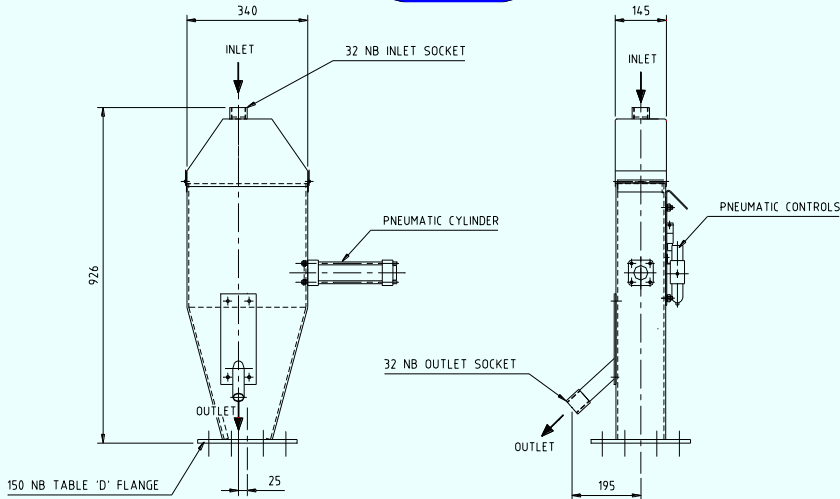

These samplers can be supplied in many different configurations and sizes. The Type D Single Slurry Sampler has a single inlet, sample outlet and reject outlet. The dual sampler has 2 inlets, separate sample outlets and a combined reject outlet. Numerous other arrangements and multiple applications can also be supplied. All equipment is designed and manufactured by QHS, so special items and one-off applications are easily accommodated. Typically, this type of sampler is installed as a secondary splitter on a line from a primary cutter or suitable tapping point on a larger pipeline.

The standard sampler is made in stainless steel. Alumina tiling can be supplied on the inside faces when the slurry is abrasive.

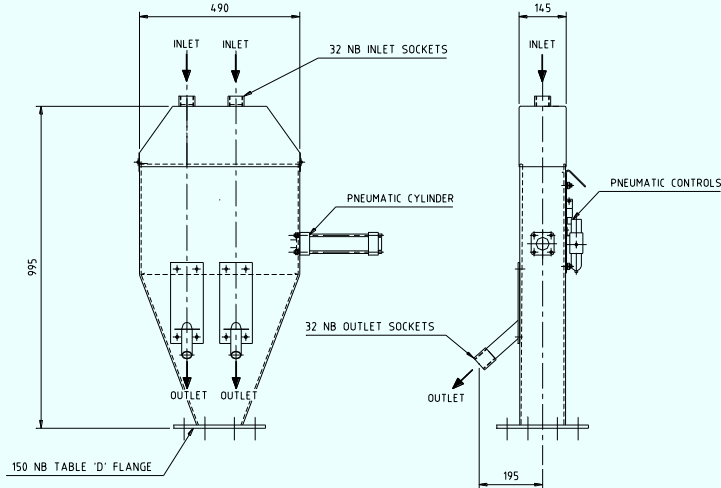

The sampling rate can be adjusted by varying the time between sample cuts and the speed of the sampler.

The electrical controls can be supplied by QHS as a small stand alone control panel, or they can be incorporated into the main plant control system. The control system can also include for other related functions, such as automatic operation of supply and flushing valves.
